

Grid computing with - and standard test cases for - a meteorological limited area model

Felix Schüller

Institute of Meteorology and Geophysics Innsbruck, Austria

7th May 2008, CMC, Montreal

Diploma thesis - Funded by the Austrian BMBWK (Federal Ministry for Education, Science and Culture) under contract GZ 4003/2- VI/4c/2004

- 1 Grid - Introduction
- 2 The Grid workflow MeteoAG
- 3 Testing the Grid
- 4 Testing the model

Starting point

Motivation:

- The need for finer scale analyses of heavy precipitation cases in the Alps ($\Delta x = 500\text{m}$)
- Use meteorological model of the atmosphere
- Computationally expensive and many similar model runs

MeteoAG

MeteoAG

- performance behavior: does it always execute the same way? → Yes → necessary for load leveling
- scaling: is there any benefit in distributing it? → Yes
- parallel behavior: does parallel environment influence results? → No
- the low error levels are meteorologically acceptable
- BUT: significant differences between GRID sites!

“Grid converged solution”

Or

Grid converged solution

Lax-Richtmeyer theorem for linear systems

stable + consistent \rightarrow convergenz

so a stable and consistent system with

- $\Delta x \rightarrow 0$
- $\Delta t \rightarrow 0$

produces a converging solution.
